

JP6254148

PURPOSE:To provide a hemostatic pad which facilitates manufacture and handling and favourably carries out the protection and tissue recovery for the bleeding part on a skin, as for a hemostatic pad using gelatin.

CONSTITUTION:Gelatin is attached on a supporting body 20 by attaching gelatin powder 30 on the surface of a supporting body 20 made of the air-permeable material such as nonwoven fabric, or allowing the supporting body 20 to be impregnated with a gelatin solution and dried, or the supporting body 20 is allowed to carry gelatin 30 in the state keeping air permeability, by forming the supporting body 20 from the fiber material covered with gelatin. Accordingly, the tissue recovery can be achieved favorably by developing the excellent strength and durability of the supporting body and the excellent hemostatic action of gelatin and further feeding outside air to a bleeding part.
